

PYTHON WEB SCRAPING

Homework Guideline

Scrape data using BeautifulSoup, Selenium, and Scrapling

I. About

Scrape data from the website using BeautifulSoup, Selenium, and Scrapling in Python.

1. Scrape the Pickup Lines

Tool: BeautifulSoup

Use the link below to scrape the pickup lines:

<https://www.womansday.com/relationships/dating-marriage/a41055149/best-pickup-lines/>

- First: scrape all the titles of each pickup line group. Ex: Best Pickup Lines, Funny Pickup Lines, ...
- Second: scrape all the pickup lines under each title.
- Third: create a dictionary that contains the title as a key and the pickup lines as a value. After that, save it as a JSON file.

2. Scrape Testimonials Content

Tool: Selenium

Use the link below to scrape the testimonials content, such as rating and text:

<https://web-scraping.dev/testimonials>

- First: wait for the cookie dialog and click the "ok" button on the URL: <https://web-scraping.dev/login?cookies=>
- Second: use Selenium to input data into the login form.
- Third: use Selenium to scrape all testimonials content on the URL: <https://web-scraping.dev/testimonials>, with auto scrolling.
- Fourth: save the data that was just scraped in JSON format.

3. Scrape Product Information

Tool: Scrapling

Use the link below to scrape the product information, such as brand, price, title, and code:

<https://www.goldonecomputer.com/>

- First: scrape all the categories' links on the Gold One Computer website.
- Second: follow each category link that was just scraped (to view all products in the category).

- Third: scrape the link of each product (the link where we can view the product in detail).
- Fourth: follow each product link (product detail link) and then scrape information such as code, title, brand, price, review count, and image for each product.
- Fifth: save the data that was just scraped in JSON format.

★ **BONUS Point:** Use a **ProxyRotator** class in Scrapling to rotate proxies while scraping.

II. Objective

- Understanding about scraping data using BeautifulSoup and Scrapling.
- Understanding about CSS selectors and XPath.
- Understanding about Selenium (waiting for elements, clicking buttons, filling forms, auto scrolling content).

III. Deadline

Date / Detail	
Collecting date	Thursday, 27/08/2026, 11:59 PM

NOTE

- + zip your code to the homework Google Drive folder (no GitHub push required)
- + add requirements.txt file for the package that used in your code
